DETAILED ACTION

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1-6 and 25 are rejected under 35 U.S.C. 102(b) as being anticipated by Webb.

Figure 3 of Webb discloses a regenerator of optical signals that comprises: a first input (24) for receiving optical signals; a reshaper input (12) connected to the first input; an optical reshaper output (18); and a lasing semiconductor amplifier (4) used as the regenerator. This structure reads on claims 1 and 25.

Claims 2-6 are taught by column 7, lines 19-35.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 10 – 12 are rejected under 35 U.S.C. 103(a) as being unpatentable over Webb.

Art Unit: 3663

Claims 10-12 fall into the category of known semiconductor laser amplifiers and, as such, would have been obvious because element 4 of Webb requires the use of a semiconductor device.

Claim 34 is rejected under 35 U.S.C. 102(b) as being anticipated by Cotter et al.

Figure 3 of Cotter et al discloses a signal regeneration circuit wherein an input optical signal (T) and a clock signal recovered from the optical signal by a marker pulse replicator (2) are input to an and gate (1 to n) in order to produce a retimed signal.

Claims 7-9 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Claims 13-24 and 26-33 are allowed.
